DETAILED ACTION

Examiner's Comments

An after-final amendment was received and entered into the record on 9/16/10.

Allowable Subject Matter

1. Claims 6, 8, 9, 12-23 and 27-30 are allowed.
2. The following is a statement of reasons for the indication of allowable subject matter:

Kazumi (JP 02-904593) teaches a method of rotolining the interior of a hollow steel (¶ 0013) article comprising: adding a composition consisting essentially of tetrafluoroethylene/perfluoro(alkyl vinyl ether) copolymer ("PFA") (¶ 0016) and non-bubble promoting (¶ 0007) metal powder (¶¶ 0016-0017) to the interior of said article; rotating said article to distribute the composition over said interior surface (¶ 0015); heating said article to melt the copolymer particles and then cooling said article (¶ 0020). Kazumi, however, does not teach is that the PFA is fluorine treatment stabilized. Kazumi also fails to expressly teach that the thickness of an overcoat which consists of the stabilized copolymer. Instead, Kazumi teaches that the overcoat also comprises metal powder and explains that the metal powder is necessary to prevent bubble formation in the layer. Kazumi also discloses that the polymer layer needs to be 0.5-1 mm in order to suppress the precipitation of the metal powder from the resin layer (¶ 0023).

Buckmaster (US 4,714,756, hereinafter "Buckmaster '756") teaches a method of preparing melt-processible tetrafluoroethylene perfluoro (alkyl vinyl ether) copolymer (abst.) to be used in rotomolding applications to make linings (Col. 1: 12-15). Buckmaster '756 further teaches that this PFA copolymer is treated with fluorine to stabilize the copolymer to reducing bubbling of the PFA during melt fabrication (2: 33-38). However, Buckmaster fails to fairly provide motivation to one of ordinary skill in the art to modify the PFA of Kazumi by treating the copolymer with fluorine because Kazumi already teaches that the metal powder prevents bubbling. Thus, both Kazumi and Buckmaster fails to fairly teach or suggest all the limitations of claim 6.

Nishio et al. (US 6,287,632) teaches a method of rotolining an article using a fluoropolymer, such as PFA, and a filler (Abst., 1:10-20) to produce a bubble-free lining (2:1-5) wherein an overcoat layer of the same polymer without a filler to applied (2:22-26) to improve durability of the layer (see, e.g., 6:32-48). However, Nishio does not teach that the overcoat consists of the fluoropolymer alone.

Art Unit: 1712

With respect to claim 16, Rau et al. (US 4,897,439) teaches that thicknesses of 0.04 inches (approx. 1 mm) and greater are suitable for overcoat layers placed on top of PFA and filler layers (Abst., 15:61-68). However, because Kazumi teaches that a thickness of between 0.5-1 mm is necessary to prevent bubbling in the layer—which is the intended purpose of the Kazumi method—there is no motivation to combined the teachings of Rau with the method of Kazumi.

Therefore, taken individually or in combination, the prior art fails to fairly teach or suggest all the limitations of claims 6, 8, 16 and 20.
